Dear Patient,

The Department of Gynecology at Klinikum Nuernberg is one of the major surgical centers for women in Northern Bavaria. All gynecological conditions can be treated here. We provide women with research-based care and are committed to using modern, more effective techniques and high-end technologies for treating gynecological conditions. With this treatment approach the benefits are vast contributing to successful outcomes and safer alternatives.

Secondary to focusing on the treatment approach and quality of treatment, quality care is to be provided with due attention to patient’s individual needs. Every woman experiences the challenges of her illness in a different way. For this reason, we take individual circumstances and situations into account in planning of treatment courses and treatments. We set great value upon providing our patients with excellent expert advice.

The management of cancer is one of the great challenges in the field of gynecology. The Department of Gynecology at Klinikum Nuernberg has great experience in providing high-quality care to women with gynecological cancer. Every case is discussed inside in a multidisciplinary tumor board on a weekly basis with experts from other participating specialty clinics. We bring together the diagnostic components, and run a search for the treatment option you will benefit the most. The recommended treatment option including alternative treatment options will subsequently be discussed with you in detail.

It is our goal to organizing excellent care around you as patient, and that you feel treated well in our clinic in every way.

Univ.-Prof. Dr. med. Cosima Brucker
Chief, Department of Gynecology

Klinikum Nuernberg’s gynecologists provide treatment options for all gynecologic conditions. We observe high-quality standards and use innovative drug therapies including minimally invasive surgery.

Laser surgery and minimally invasive gynecological robotic surgery (DaVinci Surgical System®) help reduce stress in patients and further reduce length of stay in hospital. The Department of Gynecology is certified by relevant expert societies for their diagnostics and treatment approaches they offer in all areas of obstetric and gynecologic services.

Our treatment approach provided to our patients complies with the latest scientific knowledge.

Specialty clinics and institutes at Klinikum Nürnberg collaborating closely as a multidisciplinary team uphold the highest quality standards of care. Specialists from participating specialty clinics work closely together as a team. For you as patient this means: you receive highest competence in care grouped under one roof.
Minimally Invasive Surgery

Minimally invasive endoscopic makes large abdominal incisions more and more redundant. Using laparoscopy, ovarian cysts, including abscesses, endometriosis and uterine fibroids are surgically treated. Even partial or complete removal of uterus can be performed using this approach. When indicated, laparoscopic removal of malignant gynecological tumors is an optional approach. For further diagnostic evaluation pertaining to symptoms of unclear origin and unfulfilled desire for children, exploratory diagnostic laparoscopy is able to provide valuable findings with the least effort.

Minimally Invasive Gynecological Robotic Surgery

Robotic assisted surgery is performed using the DaVinci Xi system representing the latest in surgical and robotics technologies. This technology allows precise and conservative surgical interventions, particularly for major laparoscopic procedures of benign and malignant gynecologic tumors.

Multidisciplinary Breast Center

At the Multidisciplinary Breast Center, the Department of Gynecology closely collaborates with ten other specialty clinics and institutes specializing in the treatment of breast cancer. The Breast Center additionally offers all diagnostic and treatment options for breast development disorders in females and males.

Early detection and breast preserving surgery resp. breast reconstructive surgery play a major role in breast cancer, including the use of innovative and conservative treatment options (providing for instance accurately targeted intraoperative radiotherapy from within the breast and sentinel lymph node technique). Giving an intraoperative radiotherapy boost at the time of surgery can significantly shorten the postoperative treatment time.

The Breast Center is certified and operates in full compliance with strict guidelines of the German Cancer Society and German Society of Senology. The work-flow and quality-management processes employed at the Breast Center are certified to meet DIN EN ISO Standards.

Gynecologic Cancer Center

In our clinic, our strong focus is on the treatment of gynecologic tumors. The Dysplasia Consultation Services, as an integral part of the Gynecologic Cancer Center is certified by the German Federation for Cervical Pathology and Colposcopy (AGPC). Vulvar, vaginal and cervical cancers and their precursors can be detected and treated at an early stage. In many cases, surgical procedure includes targeted laser-assisted micromanipulation.

Our surgical procedures and treatments also include
- Nerve-sparing surgical techniques for early and advanced ovarian cancers including cervical cancers
- All stages of endometrial cancer
- Vulvar cancer, when indicated using reconstruction after vulvar cancer ablative surgery

The Gynecologic Cancer Center is certified and operates in full compliance with strict guidelines of the German Cancer Society, including DIN EN ISO Standards.

Our clinic is highly experienced in all types of surgical treatment options of advanced tumor diseases, and they closely collaborate with specialists of the Department of General Surgery and the Department of Urology.

Endometriosis Center

Endometriosis has many signs and symptoms remaining undiagnosed in some cases for many years.

It is important, however, to make a correct diagnosis at an early stage.

This is made possible using minimally invasive explorative diagnostic endoscopy of the abdomen. In many cases, surgical treatment can be performed during endoscopy. Open surgery with abdominal incision is required only in rare cases. We further specialize in medical therapy of endometriosis. In many cases, additional surgical interventions can be avoided using targeted and personalized therapy.

The Endometriosis Center is certified in compliance with the strict guidelines of the German Endometriosis Research Foundation (SEF), including the European Endometriosis League (EEL) and German Endometriosis Association e.V.

Pelvic Floor Center and Genitourinary Disorders

Nearly one-third of all women develop pelvic floor disorders, and these represent the most common type of gynecological conditions. Pelvic floor dysfunction may manifest itself both in sagging or prolapse of pelvic organs and in urinary incontinence.

At the Pelvic Floor Center and Genitourinary Disorders our competent team of experienced specialists offers care from diagnosis through treatment for pelvic floor disorders. Everything you need — from experts who are
trained to treat pelvic floor disorders, to innovative, non-surgical therapies, to surgical treatments — is here in our Pelvic Floor Center and Genitourinary Disorders. Whenever possible, we prioritize the use of micro-invasive mid-urethral sling procedure to treat female stress urinary incontinence and repair of pelvic organ prolapse. In many cases, preservation of the uterus is achieved.

The Multidisciplinary Pelvic Floor Center at Klinikum Nürnberg is certified by German Continence Society e.V. It is staffed by a multidisciplinary team of gynecologists, urologists, general surgeons, including visceral and thoracic surgeons collaborating closely to solve complex clinical problems.

Patient Information and Consultation

We offer the following consultations, e.g.:

- Dysplasia Consultation Services
- Endometriosis Consultation Services
- Uterine Fibroid Consultation Services
- Continence and Pelvic Floor Disorder Consultation Services
- Targeted Cancer Drug Therapy Program

Uterine Fibroids

Uterine fibroids are the most benign tumors in women. They may develop severe bleeding, pain and infertility. We offer a wide range of surgical and conservative procedures for the treatment of uterine fibroids including uterine fibroid embolization

Outpatient Treatment Programs

Minor surgical interventions, for instance D & C (dilation and curettage), Laser therapy, explorative diagnostic laparoscopy, including minor breast surgery in most cases are performed in an outpatient setting. In addition, targeted cancer drug therapy, for instance antibody therapy and chemotherapy is also performed on an outpatient basis.
